5. Additional explanation

(1) As an indirect impact, the recycling effect of steel materials based on JISQ20915 was evaluated and the values are listed in Table [D] above. The recycling effect was calculated as the difference between the load associated with the amount of scrap input to the product production site and the load reduction associated with the collection of scrap from used steel products. The recycling rate used in the calculation was 93.7% (according to JISQ20915, domestic data for FY2022 (source: Japan Iron and Steel Federation, Steel Can Recycling Association).

②For electricity intensity, "Electricity, Japan average, FY 2018" was used.

③Primary data was obtained in FY2023.

④Components related to materials and substances are the maximum of the respective upper limits of the applicable steel standards, except for iron.

⑤Electric furnace slag and mill scale are sold to the outside as products.
